

Enterprise Systems Documentation

Sales Operations

The sales organization uses Salesforce CRM to manage Leads, Accounts, and Opportunities. Salesforce is authenticated using OAuth 2.0 and is considered critical to revenue operations.

When an Opportunity is marked as Closed-Won in Salesforce, an invoice should be created automatically in NetSuite.

Finance Operations

NetSuite ERP manages invoices, payments, and customer financial records. NetSuite uses token-based authentication and is considered business critical.

When an invoice is marked Paid in NetSuite, the corresponding customer account should be updated in Salesforce.

Engineering Operations

Jira Software is used to manage software development tasks, bugs, and sprint planning. Jira uses SAML authentication.

When a Jira issue is marked as Blocked, a notification should be sent to Slack.

When a High Priority Bug is created in Jira, a customer support case should be opened in Salesforce.

Communication

Slack is used for internal communication and operational alerts.

Procurement

Coupa is used to manage purchase requests, approvals, and procurement workflows.

When a purchase request is approved in Coupa, notify the Finance team in Slack.

Existing Integrations

The following integrations already exist:

- Jira -> Slack
- Coupa -> Slack

Workflow Frequency

Salesforce Closed-Won -> NetSuite Invoice: 5000 executions per year

NetSuite Paid Invoice -> Salesforce Account Update: 2000 executions per year

Jira Blocked Issue -> Slack Notification: 1000 executions per year

Jira High Priority Bug -> Salesforce Case: 200 executions per year

Coupa Approval -> Slack Notification: 500 executions per year

Legacy Systems

Historical customer records are stored in a legacy application.

Archived employee information is stored in an internal platform.

No additional information about these systems is available.
